Re: Prowess Treatment Planning System

We have been Prowess users for the past 7 years and are extremely satisfied with the treatment planning system (TPS). We use the TPS for 3DCRT, IMRT, Intracavitary Brachytherapy and Prostate Seeds. The TPS is very user friendly and validation measurements have demonstrated the algorithms to be clinically satisfactory. Connectivity with our linear accelerators and CT simulators has never been an issue.

Prowess has made great strides over the past several years in developing their TPS into a highly competitive product at a very competitive price. The technical staff is very cooperative and responsive to customer suggestions for product improvement. We have received several software upgrades over the past 3 years addressing virtually all of our recommendations and they are currently offering a hardware upgrade that will significantly decrease calculation times for IMRT.

We are currently embarking on a project to model the new Elekta Synergy S Beam Modulator for IMRT planning and have found Prowess to be far more interactive and eager to develop a solution than Eclipse.

Please feel free to contact me if you feel that I can be any further service.
